

CredShields

Smart Contract Audit

August 27th, 2024 • CONFIDENTIAL

Description

This document details the process and result of the Smart Contract audit performed by CredShields Technologies PTE. LTD. on behalf of Protop between July 16th, 2024, and July 19th, 2024. A retest was performed on August 13th, 2024.

1. Executive Summary -----

Protop engaged CredShields to perform a smart contract audit from July 16th, 2024, to July 19th, 2024. During this timeframe, 2 vulnerabilities were identified. **A retest was performed on August 13th, 2024, and all the bugs have been addressed.**

During the audit, 0 vulnerabilities were found with a severity rating of either High or Critical. These vulnerabilities represent the greatest immediate risk to "Protop" and should be prioritized for remediation, and fortunately, none were found.

The table below shows the in-scope assets and a breakdown of findings by severity per asset. Section 2.3 contains more information on how severity is calculated.

Assets in Scope	Critical	High	Medium	Low	info	Gas	Σ
ProtoPecuni Contract	0	0	0	2	0	0	2
	0	0	0	2	0	0	2

Table: Vulnerabilities Per Asset in Scope

The CredShields team conducted the security audit to focus on identifying vulnerabilities in the ProtoPecuni Contract's scope during the testing window while abiding by the policies set forth by the Protop team.

State of Security

To maintain a robust security posture, it is essential to continuously review and improve upon current security processes. Utilizing CredShields' continuous audit feature allows both Protop's internal security and development teams to not only identify specific vulnerabilities but also gain a deeper understanding of the current security threat landscape.

To ensure that vulnerabilities are not introduced when new features are added, or code is refactored, we recommend conducting regular security assessments. Additionally, by analyzing the root cause of resolved vulnerabilities, the internal teams at Protop can implement both manual and automated procedures to eliminate entire classes of vulnerabilities in the future. By taking a proactive approach, Protop can future-proof its security posture and protect its assets.

2. The Methodology -----

Protop engaged CredShields to perform a Smart Contract audit. The following sections cover how the engagement was put together and executed.

2.1 Preparation phase

The CredShields team meticulously reviewed all provided documents and comments in the smart contract code to gain a thorough understanding of the contract's features and functionalities. They meticulously examined all functions and created a mind map to systematically identify potential security vulnerabilities, prioritizing those that were more critical and business-sensitive for the refactored code. To confirm their findings, the team deployed a self-hosted version of the smart contract and performed verifications and validations during the audit phase.

A testing window from July 16th, 2024, to July 19th, 2024, was agreed upon during the preparation phase.

2.1.1 Scope

During the preparation phase, the following scope for the engagement was agreed upon:

IN SCOPE ASSETS
Testnet: https://amoy.polygonscan.com/address/0x1e0aA2c88d01A4Bf35644bf2d1F96A9569eDFB22
Mainnet: https://polygonscan.com/address/0xdA2334aB50F8e81530ac6F87aA63691440737660

2.1.2 Documentation

Documentation was not needed as the code was self-sufficient for understanding the project.

2.1.3 Audit Goals

CredShields uses both in-house tools and manual methods for comprehensive smart contract security auditing. The majority of the audit is done by manually reviewing the contract source code, following SWC registry standards, and an extended industry standard self-developed checklist. The team places emphasis on understanding core concepts, preparing test cases, and evaluating business logic for potential vulnerabilities.

2.1.4 Project Description

ProtoPecuni is an ERC-20 token deployed on Polygon, designed to facilitate seamless digital transactions with enhanced security and flexibility. It leverages OpenZeppelin libraries for robust and standardized token functionality.

The contract mints 144M tokens during the contract creation process automatically which is sent to the owner of the contract. Owners or users can't mint any new tokens once the contract is deployed. Users are allowed to burn their tokens.

2.2 Retesting phase

Protop is actively partnering with CredShields to validate the remediations implemented towards the discovered vulnerabilities.

2.3 Vulnerability classification and severity

CredShields follows OWASP's Risk Rating Methodology to determine the risk associated with discovered vulnerabilities. This approach considers two factors - Likelihood and Impact - which are evaluated with three possible values - **Low**, **Medium**, and **High**, based on factors such as Threat agents, Vulnerability factors, and Technical and Business Impacts. The overall severity of the risk is calculated by combining the likelihood and impact estimates.

Overall Risk Severity				
Impact	HIGH	● Medium	● High	● Critical
	MEDIUM	● Low	● Medium	● High
	LOW	● None	● Low	● Medium
		LOW	MEDIUM	HIGH
Likelihood				

Overall, the categories can be defined as described below -

1. Informational

We prioritize technical excellence and pay attention to detail in our coding practices. Our guidelines, standards, and best practices help ensure software stability and reliability. Informational vulnerabilities are opportunities for improvement and do not pose a direct risk to the contract. Code maintainers should use their own judgment on whether to address them.

2. Low

Low-risk vulnerabilities are those that either have a small impact or can't be exploited repeatedly or those the client considers insignificant based on their specific business circumstances.

3. Medium

Medium-severity vulnerabilities are those caused by weak or flawed logic in the code and can lead to exfiltration or modification of private user information. These vulnerabilities can harm the client's reputation under certain conditions and should be fixed within a specified timeframe.

4. High

High-severity vulnerabilities pose a significant risk to the Smart Contract and the organization. They can result in the loss of funds for some users, may or may not require specific conditions, and are more complex to exploit. These vulnerabilities can harm the client's reputation and should be fixed immediately.

5. Critical

Critical issues are directly exploitable bugs or security vulnerabilities that do not require specific conditions. They often result in the loss of funds and Ether from Smart Contracts or users and put sensitive user information at risk of compromise or modification. The client's reputation and financial stability will be severely impacted if these issues are not addressed immediately.

6. Gas

To address the risk and volatility of smart contracts and the use of gas as a method of payment, CredShields has introduced a "Gas" severity category. This category deals with optimizing code and refactoring to conserve gas.

2.4 CredShields staff

The following individual at CredShields managed this engagement and produced this report:

- Shashank, Co-founder CredShields shashank@CredShields.com

Please feel free to contact this individual with any questions or concerns you have about the engagement or this document.

3. Findings Summary -----

This chapter contains the results of the security assessment. Findings are sorted by their severity and grouped by the asset and SWC classification. Each asset section will include a summary. The table in the executive summary contains the total number of identified security vulnerabilities per asset per risk indication.

3.1 Findings Overview

3.1.1 Vulnerability Summary

During the security assessment, 2 security vulnerabilities were identified in the asset.

VULNERABILITY TITLE	SEVERITY	SWC Vulnerability Type
Use Ownable2Step	Low	Missing Best Practices
Outdated Pragma	Low	Outdated Pragma

Table: Findings in Smart Contracts

3.1.2 Findings Summary

SWC ID	SWC Checklist	Test Result	Notes
SWC-100	Function Default Visibility	Not Vulnerable	Not applicable after v0.5.X (Currently using solidity v >= 0.8.6)
SWC-101	Integer Overflow and Underflow	Not Vulnerable	The issue persists in versions before v0.8.X .
SWC-102	Outdated Compiler Version	Not Vulnerable	Bug ID#2
SWC-103	Floating Pragma	Not Vulnerable	Contract was not using floating pragma
SWC-104	Unchecked Call Return Value	Not Vulnerable	call() is not used
SWC-105	Unprotected Ether Withdrawal	Not Vulnerable	Appropriate function modifiers and require validations are used on sensitive functions that allow token or ether withdrawal.
SWC-106	Unprotected SELFDESTRUCT Instruction	Not Vulnerable	selfdestruct() is not used anywhere
SWC-107	Reentrancy	Not Vulnerable	No notable functions were vulnerable to it.
SWC-108	State Variable Default Visibility	Not Vulnerable	Not Vulnerable
SWC-109	Uninitialized Storage Pointer	Not Vulnerable	Not vulnerable after compiler version, v0.5.0
SWC-110	Assert Violation	Not Vulnerable	Asserts are not in use.
SWC-111	Use of Deprecated Solidity Functions	Not Vulnerable	None of the deprecated functions like block.blockhash() , msg.gas , throw , sha3() , callcode() , suicide() are in use

SWC-112	Delegatecall to Untrusted Callee	Not Vulnerable	Not Vulnerable.
SWC-113	DoS with Failed Call	Not Vulnerable	No such function was found.
SWC-114	Transaction Order Dependence	Not Vulnerable	Not Vulnerable.
SWC-115	Authorization through tx.origin	Not Vulnerable	<code>tx.origin</code> is not used anywhere in the code
SWC-116	Block values as a proxy for time	Not Vulnerable	<code>Block.timestamp</code> is not used
SWC-117	Signature Malleability	Not Vulnerable	Not used anywhere
SWC-118	Incorrect Constructor Name	Not Vulnerable	All the constructors are created using the <code>constructor</code> keyword rather than functions.
SWC-119	Shadowing State Variables	Not Vulnerable	Not applicable as this won't work during compile time after version <code>0.6.0</code>
SWC-120	Weak Sources of Randomness from Chain Attributes	Not Vulnerable	Random generators are not used.
SWC-121	Missing Protection against Signature Replay Attacks	Not Vulnerable	No such scenario was found
SWC-122	Lack of Proper Signature Verification	Not Vulnerable	Not used anywhere
SWC-123	Requirement Violation	Not Vulnerable	Not vulnerable
SWC-124	Write to Arbitrary Storage Location	Not Vulnerable	No such scenario was found
SWC-125	Incorrect Inheritance Order	Not Vulnerable	No such scenario was found
SWC-126	Insufficient Gas Griefing	Not Vulnerable	No such scenario was found
SWC-127	Arbitrary Jump with Function Type Variable	Not Vulnerable	<code>Jump</code> is not used.

SWC-128	DoS With Block Gas Limit	Not Vulnerable	Not Vulnerable.
SWC-129	Typographical Error	Not Vulnerable	No such scenario was found
SWC-130	Right-To-Left-Override control character (U+202E)	Not Vulnerable	No such scenario was found
SWC-131	Presence of unused variables	Not Vulnerable	No such scenario was found
SWC-132	Unexpected Ether balance	Not Vulnerable	No such scenario was found
SWC-133	Hash Collisions With Multiple Variable Length Arguments	Not Vulnerable	<code>abi.encodePacked()</code> or other functions are not used.
SWC-134	Message call with hardcoded gas amount	Not Vulnerable	Not used anywhere in the code
SWC-135	Code With No Effects	Not Vulnerable	No such scenario was found
SWC-136	Unencrypted Private Data On-Chain	Not Vulnerable	No such scenario was found

4. Remediation Status -----

Protop is actively partnering with CredShields from this engagement to validate the discovered vulnerabilities' remediations. A retest was performed on August 13th, 2024, and all the issues have been addressed.

Also, the table shows the remediation status of each finding.

VULNERABILITY TITLE	SEVERITY	REMEDATION STATUS
Use Ownable2Step	Low	Not Fixed [August 13th, 2024]
Outdated Pragma	Low	Fixed [August 13th, 2024]

Table: Summary of findings and status of remediation

5. Bug Reports -----

Bug ID#1 [Not Fixed]

Use Ownable2Step

Vulnerability Type

Missing Best Practises

Severity

Low

Description

The "Ownable2Step" pattern is an improvement over the traditional "Ownable" pattern, designed to enhance the security of ownership transfer functionality in a smart contract. Unlike the original "Ownable" pattern, where ownership can be transferred directly to a specified address, the "Ownable2Step" pattern introduces an additional step in the ownership transfer process. Ownership transfer only completes when the proposed new owner explicitly accepts the ownership, mitigating the risk of accidental or unintended ownership transfers to mistyped addresses.

Affected Code

- <https://amoy.polygonscan.com/address/0x1e0aA2c88d01A4Bf35644bf2d1F96A9569eDFB22#code#F1#L8>

Impact

Without the "Ownable2Step" pattern, the contract owner might inadvertently transfer ownership to an unintended or mistyped address, potentially leading to a loss of control over the contract. By adopting the "Ownable2Step" pattern, the smart contract becomes more resilient against external attacks aimed at seizing ownership or manipulating the contract's behavior.

Remediation

It is recommended to use either Ownable2Step or Ownable2StepUpgradeable depending on the smart contract.

Retest

This issue has not been fixed. It is recommended to use either Ownable2Step or Ownable2StepUpgradeable.

Bug ID#2 [**Fixed**]

Outdated Pragma

Vulnerability Type

Outdated Pragma

Severity

Low

Description

The contract was using an outdated pragma, i.e., 0.8.24. This allows the contracts to be compiled with older solidity compiler versions, making them vulnerable to the CVEs and exploits affecting that particular older version.

Affected Code

- <https://amoy.polygonscan.com/address/0x1e0aA2c88d01A4Bf35644bf2d1F96A9569eDFB22#code#F1#L8>

Impact

If the smart contract gets compiled and deployed with an older or too recent version of the solidity compiler, there's a chance that it may get compromised due to the bugs present in the older versions or unidentified exploits in the new versions.

Incompatibility issues may also arise if the contract code does not support features in other compiler versions, therefore, breaking the logic. The likelihood of exploitation is low.

Remediation

Keep the compiler versions updated in all the smart contract files. Do not allow floating pragmas anywhere. It is suggested to use the 0.8.25 pragma version.

Reference

<https://swcregistry.io/docs/SWC-103>

Retest

This issue has been fixed by updating the pragma version to 0.8.25.

6. The Disclosure -----
